Subject: Frontend Technology [25CAH-655]
Section: 25MCD KAR-1

Assignment - 1

Q1- What is Figma? Explain its key features and why its widely used in modern UI/UX design.

- Ans:-
- Figma is a cloud-based UI/UX design tool used for creating user interfaces and user experiences.
 - It allows designers to design, prototype, and collaborate in real time.
 - Figma runs on the browser, therefore no heavy installation is required.
 - Multiple designers can work on the same file simultaneously.
 - Figma is widely used because it simplifies teamwork between designers and developers.
 - Figma is commonly used for web & mobile app design.

Q2- Differentiate between Designing and Prototyping in Figma. Explain with one real-world UI example.

Ans:-

Designing

- Focuses on the visual appearance of the interface.
- Deals with layout, colours, typography and icons.
- Creates static screens.
- Used to define how the UI looks.
- Helps in visual ~~consistency~~ consistency.

ex:- Designing a login screen with text fields and a button.

Prototyping

- Focuses on interaction and user flow.
- Deals with navigation, transitions, and animations.
- Creates interactive screens.
- Used to show how the UI works.
- Helps in usability testing.

ex:- Linking the login button to the home screen to simulate navigation.

Q3- What are Components and Styles in Figma? How do they help in maintaining consistency and saving time in large projects?

Ans:- # Components:

- Reusable UI elements such as buttons, cards, and navigation bars.
- Created once and used across multiple screens.
- Changes in the main component update all instances automatically.

Styles:

- Predefined design properties like colors, text styles, and effects.

- Ensure uniform fonts, colors, and spacing across the design.
- Help maintain consistent branding.

How they Help in Large Projects:

- Maintain visual consistency across all screens.
- Save time by avoiding repetitive manual changes.
- Reduce design errors and rework.
- Make Global updates quick and efficient.

Q4- Explain Auto-Layout in Figma. How does it help in creating responsive designs for different screen sizes?

Ans:- # Auto-Layout :

- Auto-Layout is a feature that automatically manages spacing and alignment of UI elements.
- It adjusts the size of frames based on content.
- Elements resize when text or components change.
- Padding, spacing, and direction can be defined.
- Reduces manual resizing work.

How it Helps in Responsive Design:

- Automatically adapts UI for different screen sizes.
- Maintains proper spacing on mobile, tablet, and desktop layouts.
- Ensures elements grow or shrink proportionally.
- Makes designs flexible without redesigning screens.
- Improves consistency across multiple devices.

Q5- Describe the complete developer handoff process in Figma.
How are designs shared, assets exported, and code snippets generated for developers?

Ans:-

Developer Handoff in Figma:

- Developer handoff is the process of transferring designs from designer to developers.
- It ensures developers understand layout, styles, assets, and interactions.
- Figma provides built-in tools to avoid manual documentation.

Design Sharing:

- Designers share files using view or inspect access.
- Developers can view screens, components, and prototypes.
- Real-time updates ensure everyone sees the latest design.

Asset Exporting:

- Icons, images, and illustrations can be exported directly.
- Assets are downloadable in formats like PNG, SVG, and JPG.
- Export settings (size, scale) are predefined by designers.

Code Snippet Generation:

- Figma automatically generates code snippets.
- Supports CSS, iOS (Swift), and Android (XML).
- Developers can copy exact values for colors, fonts, and spacing.

Advantages:

- Reduces communication gaps.
- Saves development time.
- Minimizes design-to-code errors.
